# Маршрут вебинара

The background of the slide is a blue-tinted aerial photograph of a dense city skyline, likely New York City. Overlaid on this image is a semi-transparent network pattern consisting of numerous small dots connected by thin lines, creating a web-like structure. The text "Aggregation pipeline" is centered in the middle of the slide in a white, bold, sans-serif font.

# Aggregation pipeline

# Aggregation Pipeline

Aggregation operations process data records and return computed results.

Aggregation operations group values from multiple documents together, and can perform a variety of operations on the grouped data to return a single result.

MongoDB provides three ways to perform aggregation: the [aggregation pipeline](#), the [map-reduce function](#), and [single purpose aggregation methods](#).

# Aggregation Pipeline

Collection

↓  
`db.orders.aggregate( [`  
    `$match stage → { $match: { status: "A" } },`  
    `$group stage → { $group: { _id: "$cust_id", total: { $sum: "$amount" } } }`  
    `])`

{ cust_id: "A123", amount: 500, status: "A" }
{ cust_id: "A123", amount: 250, status: "A" }
{ cust_id: "B212", amount: 200, status: "A" }
{ cust_id: "A123", amount: 300, status: "D" }

orders

\$match →

{ cust_id: "A123", amount: 500, status: "A" }
{ cust_id: "A123", amount: 250, status: "A" }
{ cust_id: "B212", amount: 200, status: "A" }

\$group →

{ _id: "A123", total: 750 }
{ _id: "B212", total: 200 }

# Aggregation Pipeline

практика

# Aggregation Pipeline Stages

```
db.collection.aggregate( [ { <stage> }, ... ] )
```

<https://docs.mongodb.com/manual/reference/operator/aggregation-pipeline/#aggregation-pipeline-operator-reference>

# Aggregation Pipeline

## SQL Aggregation Terms and Corresponding MongoDB Aggregation Operators

SQL Term	MongoDB Operator
SELECT	\$project
WHERE	\$match
GROUP BY	\$group
HAVING	\$match
ORDER BY	\$sort
LIMIT	\$limit
SUM	\$sum
COUNT	\$count
JOIN	\$lookup

# Aggregation Pipeline

## Stages Available for Updates

Starting in MongoDB 4.2, you can use the aggregation pipeline for updates in:

### Command mongo Shell Methods

[findAndModify](#)

[db.collection.findOneAndUpdate\(\)](#)

[db.collection.findAndModify\(\)](#)

[update](#)

[db.collection.updateOne\(\)](#)

[db.collection.updateMany\(\)](#)

[db.collection.update\(\)](#)

[Bulk.find.update\(\)](#)

[Bulk.find.updateOne\(\)](#)

[Bulk.find.upsert\(\)](#)

# Aggregation Pipeline

## Ограничения:

- All except the [\\$out](#), [\\$merge](#), and [\\$geoNear](#) stages can appear multiple times in a pipeline.
- Pipeline stages have a limit of 100 MiB (100 \* 1024 \* 1024 bytes) of RAM
- <https://docs.mongodb.com/manual/core/aggregation-pipeline-limits/>  
<https://www.mongodb.com/community/forums/t/mongodb-meaning-of-pipeline-aggregation-100mb-limit/99553>
- you can set the [allowDiskUse](#) option in the [aggregate\(\)](#) method

# Aggregation Pipeline & Indexes

## Pipeline Operators and Indexes

MongoDB's [query planner](#) analyzes an aggregation pipeline to determine whether [indexes](#) can be used to improve pipeline performance. For example, the following pipeline stages can take advantage of indexes:

### **\$match**

The [\\$match](#) stage can use an index to filter documents if it occurs at the beginning of a pipeline.

### **\$sort**

The [\\$sort](#) stage can use an index as long as it is not preceded by a [\\$project](#), [\\$unwind](#), or [\\$group](#) stage.

### **\$group**

The [\\$group](#) stage can sometimes use an index to find the first document in each group

See [Optimization to Return the First Document of Each Group](#) for an example.

### **\$geoNear**

The [\\$geoNear](#) pipeline operator takes advantage of a geospatial index. When using [\\$geoNear](#), the [\\$geoNear](#) pipeline operation must appear as the first stage in an aggregation pipeline.

# Aggregation pipeline optimization

<https://docs.mongodb.com/manual/core/aggregation-pipeline-optimization/>

Статья по более менее подробному разбору этапов пайплайна

<https://studio3t.com/knowledge-base/articles/mongodb-aggregation-framework/>

The background of the slide is a high-angle, blue-tinted aerial photograph of a city skyline, likely New York City, showing numerous skyscrapers and buildings. A semi-transparent blue band with a white geometric network pattern of dots and lines runs horizontally across the middle of the image, serving as a backdrop for the title text.

# Single Purpose Aggregation Operations

# Single Purpose

[db.collection.count\(\)](#)

**db.collection.count(*query, options*)**

Options:

limit	integer	Optional. The maximum number of documents to count.
skip	integer	Optional. The number of documents to skip before counting.
hint	string or document	Optional. An index name hint or specification for the query.
maxTimeMS	integer	Optional. The maximum amount of time to allow the query to run.
readConcern	string	Optional. Specifies the <a href="#"><u>read concern</u></a> . The default level is <a href="#"><u>"local"</u></a> .

On a sharded cluster, [db.collection.count\(\)](#) without a query predicate can result in an *inaccurate* count if [orphaned documents](#) exist or if a [chunk migration](#) is in progress.

**db.orders.count( { ord\_dt: { \$gt: new Date('01/01/2012') } } )**

The query is equivalent to the following:

**db.orders.find( { ord\_dt: { \$gt: new Date('01/01/2012') } } ).count()**

# Single Purpose

[db.collection.distinct\(\)](#)

`db.collection.distinct(field, query, options)`

Options:

- collation

*npumep*

# Single Purpose

[db.collection.estimatedDocumentCount\(\)](#)

**db.collection.estimatedDocumentCount(*options*)**

- does not take a query filter and instead uses metadata to return the count for a collection.
- After an unclean shutdown, the count may be incorrect.
- Run [validate](#) on each collection on the [mongod](#) to restore the correct statistics after an unclean shutdown.

**МИНИТЕСТ**

**<https://forms.gle/hCRb6nfjwBgvTb4W8>**

**1-2 минуты**

The background of the slide is a high-angle, blue-tinted aerial photograph of a dense urban skyline, likely New York City. Overlaid on this image is a semi-transparent blue band across the center, which contains a white network diagram of interconnected nodes and lines. The text 'Map Reduce' is centered within this band in a large, white, sans-serif font.

# Map Reduce

# Map Reduce

## Map-Reduce

MongoDB also provides [map-reduce](#) operations to perform aggregation. In general, map-reduce operations have two phases: a *map* stage that processes each document and *emits* one or more objects for each input document, and *reduce* phase that combines the output of the map operation. Optionally, map-reduce can have a *finalize* stage to make final modifications to the result. Like other aggregation operations, map-reduce can specify a query condition to select the input documents as well as sort and limit the results.

Map-reduce uses custom JavaScript functions to perform the map and reduce operations, as well as the optional *finalize* operation. While the custom JavaScript provide great flexibility compared to the aggregation pipeline, in general, map-reduce is less efficient and more complex than the aggregation pipeline.

Map-reduce can operate on a [sharded collection](#). Map-reduce operations can also output to a sharded collection. See [Map-Reduce and Sharded Collections](#) for details.

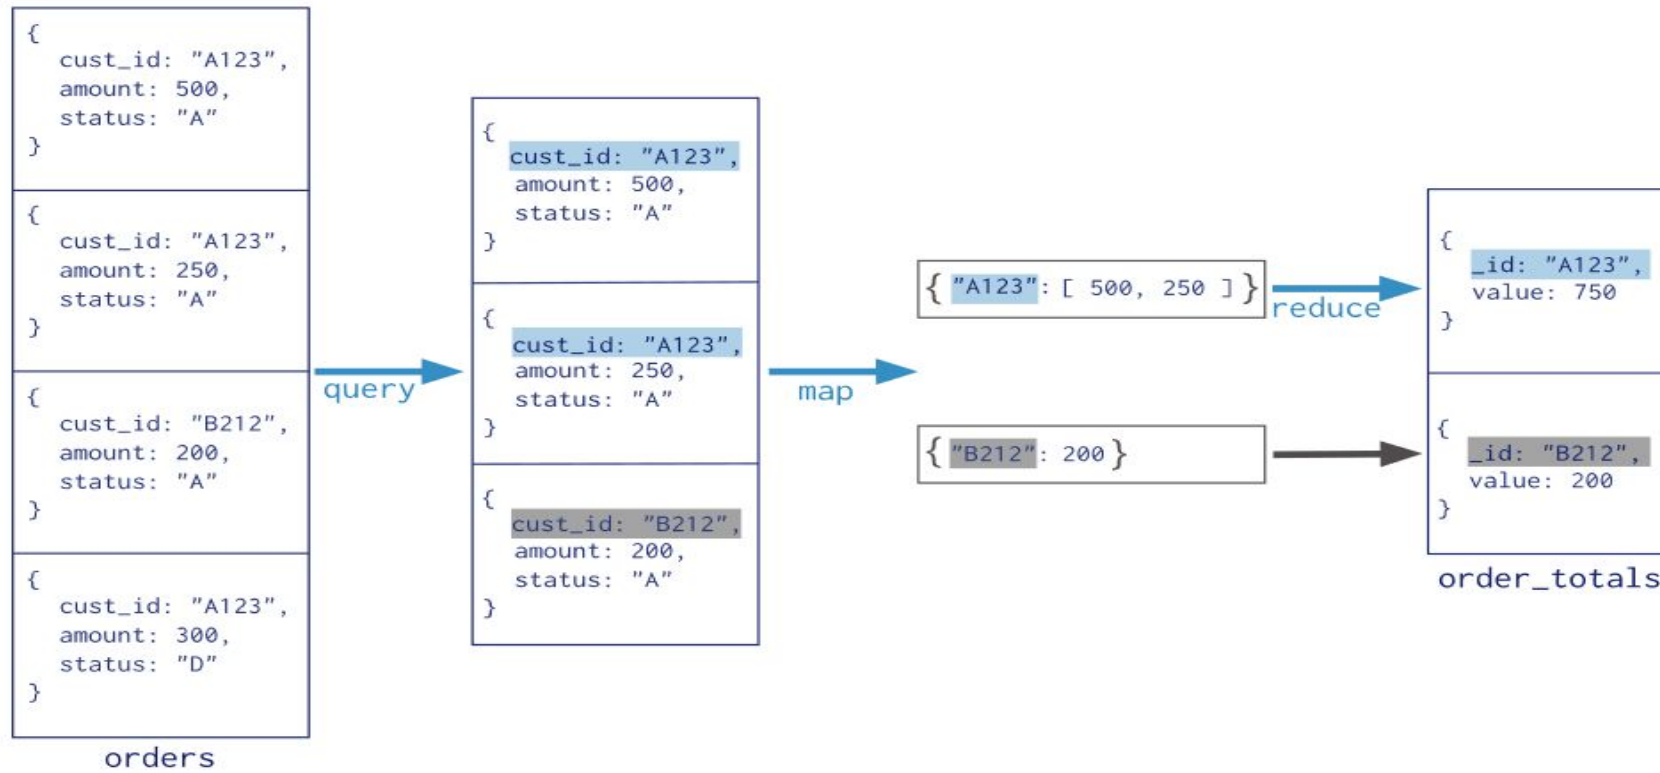

### Note

Starting in MongoDB 2.4, certain [mongo](#) shell functions and properties are inaccessible in map-reduce operations. MongoDB 2.4 also provides support for multiple JavaScript operations to run at the same time. Before MongoDB 2.4, JavaScript code executed in a single thread, raising concurrency issues for map-reduce.

# Map Reduce

Collection  
↓  
db.orders.mapReduce(  
 map → function() { emit( this.cust\_id, this.amount ); },  
 reduce → function(key, values) { return Array.sum( values ) },  
 {  
 query → { status: "A" },  
 output → "order\_totals"  
 }  
)

# Map Reduce

```
>db.collection.mapReduce(  
  function() {emit(key,value);}, //map function  
  function(key,values) {return reduceFunction}, { //reduce function  
    out: collection,  
    query: document,  
    sort: document,  
    limit: number  
  }  
)
```

<https://docs.mongodb.com/manual/reference/command/mapReduce/>

# Map Reduce

требования на реализацию функции **reduce**. Вот они:

1. Тип возвращаемого значения функции **reduce** должен совпадать с типом значения, которое выдается функцией **map** (второй параметр функции **emit**)
2. Должно выполняться равенство (ассоциативность):

$$\text{reduce}(\text{key}, [ \text{A}, \text{reduce}(\text{key}, [ \text{B}, \text{C} ] ) ] ) == \text{reduce}( \text{key}, [ \text{A}, \text{B}, \text{C} ] )$$

3. Повторное применение операции **Reduce** к полученной паре <ключ, значение> не должно влиять на результат (идемпотентность)

$$\text{reduce}( \text{key}, [ \text{reduce}(\text{key}, \text{valuesArray} ) ] ) == \text{reduce}( \text{key}, \text{valuesArray} )$$

4. Порядок значений, передаваемых функции **reduce**, не должен влиять на результат (коммутативность)

$$\text{reduce}( \text{key}, [ \text{A}, \text{B} ] ) == \text{reduce}( \text{key}, [ \text{B}, \text{A} ] )$$

<https://docs.mongodb.com/manual/reference/command/mapReduce/#requirements-for-the-map-function>

# Map Reduce. Практика

```
{  name : "John",  
    age : 23,  
    interests : ["football", "IT", "cooking"]  
}
```

На выходе мы хотим получить коллекцию такого типа:

```
{  key: "football",  
    value: 1349  
},  
{  key: "MongoDB",  
    value: 58  
},
```

# Map Reduce

Рассмотрим другую задачу. Предположим, мы хотим узнать среднее количество интересов у людей разных возрастов

??

Если внимательно посмотреть на **требования** к функции **reduce**, то становится ясно, что в ее рамках среднее арифметическое вычислить **не удастся**, так как эта математическая операция **не удовлетворяет 1 и 2 требованию**:

- **кроме несовпадения типов (int -> double),**
- **среднее средних не равно среднему**

# Map Reduce

Чтобы в итоговой коллекции получить искомое среднее арифметическое, можно воспользоваться операцией **Finalize** — она применяется к финальной паре  $\langle key, value \rangle$ , полученной после выполнения всех операций **Reduce** с ключом **key**:

```
function finalize(key, reducedValue) {  
    return reducedValue.interests_count / reducedValue.count;  
}
```

# Map Reduce

Starting in version 4.2, MongoDB deprecates:

- The map-reduce option to *create* a new sharded collection as well as the use of the [sharded](#) option for map-reduce. To output to a sharded collection, create the sharded collection first. MongoDB 4.2 also deprecates the replacement of an existing sharded collection.
- The explicit specification of [nonAtomic: false](#) option.

# Map Reduce

The **map function** has the following requirements:

- The map function should *not* access the database for any reason.
- The map function should be pure, or have *no* impact outside of the function (i.e. side effects.)
- A single emit can only hold half of MongoDB's [maximum BSON document size](#).
- The map function may optionally call emit(key,value) any number of times to create an output document associating key with value.

# Map Reduce

The **reduce function** exhibits the following behaviors:

- The reduce function should *not* access the database, even to perform read operations.
- The reduce function should *not* affect the outside system.
- MongoDB will **not** call the reduce function for a key that has only a single value. The values argument is an array whose elements are the value objects that are “mapped” to the key.
- MongoDB can invoke the reduce function more than once for the same key. In this case, the previous output from the reduce function for that key will become one of the input values to the next reduce function invocation for that key.
- The reduce function can access the variables defined in the scope parameter.
- The inputs to reduce must not be larger than half of MongoDB’s [maximum BSON document size](#). This requirement may be violated when large documents are returned and then joined together in subsequent reduce steps.

# Map Reduce

The **finalize function** has the following prototype:

```
function(key, reducedValue) {  
    ...  
    return modifiedObject;  
}
```

The finalize function receives as its arguments a key value and the reducedValue from the reduce function. Be aware that:

- The finalize function should *not* access the database for any reason.
- The finalize function should be pure, or have *no* impact outside of the function (i.e. side effects.)
- The finalize function can access the variables defined in the scope parameter.

	<a href="#">aggregate</a> / <a href="#">db.collection.aggregate()</a>	<a href="#">mapReduce</a> / <a href="#">db.collection.mapReduce()</a>
<b>Description</b>	<p>Designed with specific goals of improving performance and usability for aggregation tasks.</p> <p>Uses a “pipeline” approach where objects are transformed as they pass through a series of pipeline operators such as <a href="#">\$group</a>, <a href="#">\$match</a>, and <a href="#">\$sort</a>.</p> <p>See <a href="#">Aggregation Pipeline Operators</a> for more information on the pipeline operators.</p>	<p>Implements the Map-Reduce aggregation for processing large data sets.</p>

# Фичи

	<a href="#">aggregate</a> / <a href="#">db.collection.aggregate()</a>	<a href="#">mapReduce</a> / <a href="#">db.collection.mapReduce()</a>
<b>Flexibility</b>	<p>Limited to the operators and expressions supported by the aggregation pipeline.</p> <p>However, can add computed fields, create new virtual sub-objects, and extract sub-fields into the top-level of results by using the <a href="#">\$project</a> pipeline operator.</p> <p>See <a href="#">\$project</a> for more information as well as <a href="#">Aggregation Pipeline Operators</a> for more information on all the available pipeline operators.</p>	<p>Custom map, reduce and finalize JavaScript functions offer flexibility to aggregation logic.</p> <p>See <a href="#">mapReduce</a> for details and restrictions on the functions.</p>

The image features a high-angle, aerial view of a dense urban landscape, likely New York City, with numerous skyscrapers and buildings. The entire image is overlaid with a semi-transparent blue layer. A network of thin, light blue lines connects various points across the blue area, creating a web-like pattern. The word "Geo" is centered in the middle of the image in a white, sans-serif font.

Geo

# Geo

<https://docs.mongodb.com/manual/reference/command/geoSearch/#dbcmd.geoSearch>

The [geoSearch](#) command accepts a [document](#) that contains the following fields.

geoSearch	string	The collection to query.
search	document	Query to filter documents.
near	array	Coordinates of a point.
maxDistance	number	Optional. Maximum distance from the specified point.
limit	number	Optional. Maximum number of documents to return.
readConcern	document	Optional. Specifies the <a href="#">read concern</a>

# Geo

## Limit

Unless specified otherwise, the [geoSearch](#) command limits results to 50 documents.

## Sharded Clusters

[geoSearch](#) is not supported for sharded clusters.

# Geo

```
db.runCommand({  
  geoSearch : "places",  
  near: [ -73.9667, 40.78 ],  
  maxDistance : 6,  
  search : { type : "restaurant" },  
  limit : 30  
})
```

The background of the slide features an aerial view of a dense city skyline, likely New York City, with numerous skyscrapers. The image is overlaid with a semi-transparent blue gradient and a network of white lines connecting various points, creating a digital or technological aesthetic. The word "Транзакции" is centered in the middle of the slide in a large, white, sans-serif font.

# Транзакции

# ACID

ответ - транзакционные системы, OLTP - **O**nline **T**ransaction **P**rocessing

## ACID

- **Atomicity** — Атомарность
- **Consistency** — Согласованность
- **Isolation** — Изолированность
- **Durability** — Долговечность

транзакция (transaction)

- называется множество операций, выполняемое приложением
- которое переводит базу данных из одного корректного состояния в другое корректное состояние (согласованность)
- при условии, что транзакция выполнена полностью (атомарность)
- и без помех со стороны других транзакций (изолированность)

# Транзакции

<https://docs.mongodb.com/manual/core/transactions/>

**In version 4.2**, MongoDB introduces distributed transactions, which adds support for multi-document transactions on sharded clusters and incorporates the existing support for multi-document transactions on replica sets.

To use transactions on MongoDB 4.2 deployments (replica sets and sharded clusters), clients **must** use MongoDB drivers updated for MongoDB 4.2

<https://docs.mongodb.com/manual/core/transactions-operations/>

The image features a high-angle, aerial view of a dense urban skyline, likely New York City, with numerous skyscrapers and buildings. The entire image is overlaid with a semi-transparent blue and green gradient. A network of thin, light blue lines connects various points across the image, creating a digital or data network aesthetic. The word "View" is centered in the middle of the image in a white, sans-serif font.

View

# Views
